

Air Quality Permit and Dust Control Plan Requirements

The City of St. George Air Quality Regulations Ordinance 2007-12-005 designates minimum requirements for construction and development activities and other specified land uses in order to reduce fugitive dust and corresponding particulate matter emissions.

Requirements include the submittal of an application for an Air Quality Permit and a dust control plan on projects that are one or more acres in size. The application must be submitted and approved prior to initiating activities on any site that is one or more acres in size. The review and approval for an Air Quality Permit will dovetail with the issuance of a grading and/or building permit.

Applications and specifications can be downloaded from the St. George City web site at www.sgcity.org Reference the city forms and applications tab on the home page.

Development and Construction Activity Projects should reference the “Air Quality Permit Application” and “Project Info Sign Requirements” which pertain to any construction activity involving in aggregate one or more acres of disturbed area.
